

ABSTRACT

A hanger for retaining insulation blankets disposed between adjacent joists or rafters, the
5 hanger having an L-shaped hanger bracket received in sliding relationship by a U-shaped
mounting bracket, wherein the mounting bracket is placed onto the joist or rafter and the height
of the hanger bracket is adjustable relative to the mounting bracket for proper location of the
insulation blanket dependent on the dimensions of the joist or rafter. Cooperating structural
components on the mounting bracket and on the hanger bracket retain the hanger bracket in the
10 proper disposition while allowing the relative position to be adjusted with relatively little force.
Retention members to retain the insulation blanket and nail apertures for fixation of the hanger
bracket without need for the mounting bracket are provided on the hanger bracket.
